

Corvallis teff grass

- ✓ **Medium-late Maturity**
- ✓ **Excellent for Hay/Grazing**
- ✓ **Improved Disease Resistance**

CORVALLIS Teff Grass is a warm-season annual grass with timothy-like forage quality. Teff, or *Eragrostis tef*, is an annual grass out of the lovegrass family. Native to Ethiopia, teff is an important food grain similar to millet, except it is a much smaller seed - 1.3 million seeds per pound.

CORVALLIS Teff Grass is very palatable, easy to digest and has excellent feed value. It is endo-phyte free and especially desirable by horses.

It can be harvested multiple times and used as hay or silage. Teff hay can be a sought after commodity. Compared to other warm-season grasses, **CORVALLIS Teff Grass** has the ability to produce both high tonnage (4-8 tons/acre) and high quality forage (similar to timothy) throughout the summer months.

As shown in the adjacent table, **CORVALLIS Teff Grass** is med-late maturing and has very good forage performance and summer survivability.

CORVALLIS Teff Grass performs very well in both waterlogged soils and in droughty conditions. As a species, teff is said to be disease free.

Teff needs to be planted no deeper than 1/4" on a firm bed with good seed-to-soil contact when soil temperatures rise above 65° F. Too early, too deep, too fluffy of soil - all can lead to establishment failure. Also, cutting it too short will reduce its ability to regrow.

SEEDING RATES

Raw: 4-6 lbs./acre drilled
5-7 lbs./acre broadcast
Coated: 8-10 lbs./acre drilled
10-12 lbs./acre broadcast

University of Kentucky – Lexington, KY, sown May 21, 2014
